search box operates on order number, site ID, site, status, heat

On page load, all orders that are not closed are included in the list. User's filters narrow the list, in the front end.

Plus button adds a blank line to the list of orders just below the hilited plumber. It then waits 1000 milliseconds, then navigates to the previously selected details screen, the first one if no choice has been made prior.

If there is a note, the note icon shows, and shows the most recent note on hover.

Extends using native scrolling. Header elements are fixed.

Status = "Open" shows all live orders; any completed orders are omitted. However, if the user chooses 'completed', it will filter only completed orders and show them. If the user switches back to "Open" the completed orders will be omitted again. There is no "All" option on the status filter.

Do we need some kind of date on this, like date created, or target completion date, or target date of current status?

Installers cannot be deleted if they are connected to any order ever. They must be disconnected from all orders to be able ot be deleted.

Separate out the address fields so they can be sorted that way. Sometimes they need to find all the plumbers in Louisiana, or maybe in Shreveport. The Search for LA might find Louisiana AND Los Angeles.

The heat designation is derived by looking at the plumbers non-closed orders with a status for which (s)he is responsible. The order with the status in the highest heat shows the heat for that plumber.

Extends using native scrolling. Header elements are fixed.

This is the list that shows for all orders. The days entered here apply to all orders. Changes made here, such as deleting a status, or creating a new status, or a change to the caution days, take effect for all orders immediately. If a new status is added here and open orders have completed statuses below the new status in the list, the new status will be marked complete. If the status name is changed, it will still be treated as the same status with completions on orders remaining the same.

On an order, these initiate marked as "Inactive", except for the top one. The top one initiates as "Ready". Let's call this field "mark" as saying a status record has a status is a little confusing. Once completed, the status record is marked "Complete".

When a status is marked complete, the statuses entered as downstream dependencies are marked "Ready". There can be more than one "Ready" status on an order at a time. On the order's status list, an empty checkbox only appears when the status is marked as "Ready" - before that, the order's status cannot be set on that record.

If an order status is marked complete, but there is another status record which also lists the status record as a downstream trigger which is not complete, the status shall not be marked ready. Once the other status record is marked complete, it will make the same check to discover that all referenced upstream statuses are complete, and then mark it's downstream trigger status "Ready".

The screenshot shows a web application interface with a large red 'X' overlaid across it. A yellow rectangular note is centered over the 'X' with the text "No longer needed for now".

The interface elements visible include:

- A left sidebar menu with items: Refs, Message, Order Statuses, Site Ref Tables, Event Ref Tables, Node Ref Tables, Hardware Ref Tables, Time Zones, and Locales.
- A central panel titled "Message Template" containing a search bar and a list of templates: MPLAB, Xplan, and Ocean Freight.
- A right panel titled "Subject" with the value "MPLAB". Below it is a rich text editor with a toolbar (bold, italic, underline, link, style, list, link, unlink, image, smiley) and the text: "Dear [To:Name]", "The Lady of the Lake, he... shimmering samite, held aloft", "Excalibur from the... by divine providence that I,", "Arthur, was t... am your king.", and "Va... witch?".
